**B**OTH teacher and student will find in this book a comprehensive guide to practical lettering and poster art. Whether the work is done for a livelihood or for the pleasure it affords, these working examples, alphabets and layouts should save much time and eliminate misdirected effort.

Modern merchandising is so dependent upon cards to sell its wares that we seldom see displays without them. Supplying this demand has taught us that an experienced letterer can do about fifty per cent more work with a pen than he can with a brush, and do it better. This explains why the bulk of display cards are now pen lettered. It is quite a feat to letter a mass of copy on a small card with a brush and the artist receives no more for it than for one lettered with a pen. When the work appears uniform, easy to read, and is ready on time, the customer is not concerned with how it is made.

The Style "A" Speedball was the first pen of its kind. Developed at a time when display advertising was influenced by the square finish German poster letters, which were very difficult to reproduce with the old pens and brushes, this new pen produced them single stroke. When round Gothics came into vogue the Style "B" pen proved to be the best all-round lettering tool for the purpose. Later there was a renewed interest in the more graceful Roman and Italic styles. The beautiful characters originated by the Italians with their hard-cut reed pens, and the variations later designed for printing use by French and English designers, challenged the speed and skill of letterers and artists everywhere. Thus a demand was created for a lettering tool that would duplicate the strokes designed with the flexible reed, and the Style "C" Speedball successfully met these requirements. The next period saw the development of the poster Romans. These were first designed with the Style "B" pen building up the thicker elements with additional strokes. This "building up" took extra time for which the artist was not paid. So the call for a tool that would produce these bold alphabets as easily and quickly as the Style "C" pen did the thick-and-thin letters was answered with the Style "D" Speedball. This pen has an oval marking point and is remarkably easy to handle. All four styles are equipped with triple reservoir ink retainers. The large reservoirs carry the ink and feed it to the auxiliary reservoir over the tip, which serves as an automatic check by spreading it over the entire marking surface as it is used.

To successfully handle any tool, it is helpful for the operator to become familiar with its limitations as well as its potentialities. In the production of letters by hand, choose the size and style of pen that will produce their elements with the least effort. When there is a Speedball designed for every different alphabet, it is not smart to try to form letters with a pen or brush that is not adapted to their production. Such efforts are generally misdirected and usually result in a failure or a wasteful expenditure of time and effort. If you desire thicker or wider elements than your pen will form single stroke, you can produce them by doubling or tripling the strokes. For larger letters a brush should be used.

The use of a T-square, ruler or compass in drawing the elements of any letter is seldom recommended. These instruments should be used for ruling or penciling guide lines. A letter that is ruled becomes a mechanical draft. It may resemble a type but is hard to substitute for hand work. The freedom, grace and individual touch of hand lettercraft usually result from the rhythmic training of the hand, arm and fingers to act in unison, embodying a continuity of movements much the same as those taught in penmanship.

Without the proper inks it is difficult to get the best results from any pen. Thin, watery, transparent inks or heavy, thick, gummy, sticky masses never produce good results. Most standard brands of waterproof black drawing ink can be used for lettering purposes. When good lettering inks are not available, opaque colors will be found more practical for show card work than transparent colored inks. Show card colors prepared for brush use will work satisfactorily in pens when thinned to a free flowing consistency with this solution—water, nine ounces, alcohol, one ounce, gum mucilage, one part, and a few drops of glycerine. Diluted show card colors must be kept well stirred and of a consistency that will permit them to flow freely from the pen. Do not prepare a large quantity because they work best when freshly mixed. When colors flow too slowly, raise the feeder on top of the pen a little. When using white or opaque colors, brush pens occasionally with a wet toothbrush to prevent feeds from getting clogged. Crusted pens should be cleaned before using.

Letterers who desire a specially prepared lettering ink that can be used more successfully in this type of drawing and lettering pen can obtain Speedball inks from their stationer or art dealer. They are made in all the brilliant colors of the rainbow, and black and white.

Learn the Italic alphabets with the Style C pens before trying those made with the Style D.

## LETTER SPACING

Good spacing is more important than good lettering. Many beginners who can make a fair alphabet have too much trouble with letter spacing. If an effort is made to equalize the space between the letters while learning their construction, this can be avoided. A page of lettering properly done has an even tone over all. Keep this in mind and study your finished work with half-closed eyes to find the gaps or dark spots in it.

Correct spacing does not mean using a ruler to make the areas that the letters occupy, or the spaces between them, equal. Letters spaced in such mechanical fashion seldom appear uniform and the effect produced is detrimental to legibility. The experienced letterer achieves correct spacing intuitively. Such work is "optically equalized." But fortunately for the beginner, whose sense of equalization may not be fully developed, it is based upon simple principles that afford something tangible to work with and that anyone can learn in a few minutes. These rules of good spacing are:

1. Different letters and dividing areas seldom occupy like spaces.
2. Words read better when the spaces between the letters are less than half the space occupied by the letters themselves.
3. For convenience, letters may be divided into three classes: *Regular*, E·H·I·M·N· and U; *Irregular*, A·F·J·K·L·P·R·T·V·W·X·Y and Z; *Circular*, B·C·D·G·O·(P)·Q·(R)·S·& and ?.
4. Ugly gaps between irregular shaped letters can be avoided by fitting them closer together according to their shape.
5. Circular and irregular shaped letters should cut into the space or spaces between them and the letters adjoining their curved or irregular sides, and the amount thus taken from the 'dividing' areas should be about equal to the unused space at the top and bottom of the block that squares the letter's apportioned area.
6. Letters can also be divided into groups called *Narrow*, B·E·F·I·J·L·P·S·T·Y and ?; *Normal*, C·D·G·H·K·(·)·Q·R·U·V·X·Z and & and *Wide*, A·M·N and W.
7. Compressing a wide letter into the same space as that occupied by a narrow or a normal letter causes it to appear blacker than the rest of the letters. And stretching a narrow letter into the space of a wide one makes it appear lighter than the rest. These faults cause lettering to appear spotty and hard to read.

The chart on Page 15 illustrates these laws of letter spacing. The full space as it appears between two straight letters is shown by the stippled block marked "A." Block "B" illustrates the dividing area between two circular letters. Note how the letters cut into it. Block "C" shows how the area appears between a circular and a straight letter. Block "D" shows the area between an irregular and a straight letter. Note that the space (marked X) at the top and bottom of a circular letter approximately equals what the letter cuts out of the dividing area (also marked with an X). Possibly this is better illustrated in the smaller diagram at the top. The irregular letters must be fitted a bit closer together to compensate for their shape.

Combinations shown below the chart illustrate how the principles work when applied to various words. The first example, "Minnetwata," shows the mechanical spacing of straight letters. Each letter occupies the same area and the dividing areas are likewise the same. By comparing this line with the second, which is the same word arranged according to the principles given above, you will notice that the letters M, N, W and A require more space to keep them from appearing blacker than the rest, and that in the first line the spaces between the letters (marked X) are too great in area due to the irregular shapes of the letters themselves. In other words, the faults in the first line were remedied in the second line simply by fitting the letters closer together and expanding the letters that should be wider (M·N·W and A).

The third and fourth lines, "Poodle Dog," illustrate the difference between the mechanical and the optical spacing of circular letters. In the third line the letters all are of uniform width and the spaces between them also are uniform. The result is rather irritating and difficult to read, the letters appearing to be more or less unrelated. Note the ugly gaps caused by the combination in uniform spaces of circular and irregular shaped letters. Now compare this line with the fourth, which is exactly the same length, and see how these faults have been eliminated. The circular strokes have been rounded out, the wider letters expanded, and all letters fitted closer together, giving the line a more even tone.

The fifth line, "Dooming vs. Dooming," is another illustration of the difference between mechanically and optically spaced letters. Here letters of the same size and shape are used in both cases but the increased dividing areas (marked X) in the first example, caused by the mechanical spacing of the circular letters, destroys the unity of the word. This fault is corrected in the second example by spacing these circular letters closer together. When good lettering appears uneven, spotty or hard to read you will always find the spacing at fault.

BALANCED ABOUT FIVE PER CENT HIGHER

Showing a good arrangement of the same copy - Blocks are balanced upon optical center with harmonious margins.

## BALANCING THE LAYOUT

"Layout" is the printers' word for the arrangement of "copy." It is a very important subject for even good lettering, correctly spaced, is ineffective if poorly arranged. Copy containing only a

few words, and perhaps an illustration, is not hard to lay out. But copy consisting of many phrases, sentences, paragraphs and illustrations can be better handled when it has been carefully divided into appropriate blocks before any attempt is made to arrange it on the card.

The quickest way to learn how to balance a layout is to treat all words, illustrations, border ornaments and color masses as though they were children's building blocks. Group the word blocks into larger phrase blocks (though sometimes a single word is a block in itself), and then balance all pictures, spots of color or decorative masses with these phrase blocks according to their size and attraction. It is easy to see how this scheme minimizes layout problems because, instead of a lot of individual words, there are only a few masses or groups to fit into a given space. By keeping the blocks simple in shape it is not difficult to arrange them in a pleasing and effective manner. By making a dummy layout on paper and cutting out the different blocks you can shift them around until you are satisfied with the layout before applying the ink.

When there is considerable copy to go on a card it should not all be done in the same size lettering. This would make the poster look like a page out of a book. The difference in the size of the lettering naturally depends upon the relative importance of the various words or phrase blocks. Less important blocks are often lettered with the Italic alphabet harmonizing with the style of letter used for the rest of the copy. It is not generally considered the best of taste to mix Gothic letters with the Roman and Text styles on the same showcard, poster or banner.

The two cards above illustrate the difference between a good and a bad arrangement of the same blocks on a show-card.

A Square mechanically fitted into a square, with the same margins all around, feels bottom heavy and out of place, even though all elements are perfectly related. Precision of this character is uninteresting. The monotony is relieved by allowing greater margin at the bottom, to offset the influence of gravitation.

APPEARS  
HARMONIOUSLY  
INTERESTING  
*when Balanced  
upon optical center*

The Circle when perfectly spaced in a square, with equal margins all around, does not appear harmonious, because their elements are in no way related. It will fit more comfortably in a shield or octagon as it conforms more closely to such shapes.

The triangle never looks right in a circle or a square because its elements do not harmonize. The lines of the shield mate better with either triangle or circle.

TOO MUCH  
CONTRAST  
CAUSES THESE  
SPACES TO

combinations,*

*note the pleasing relation  
between panel and borders*

A Diamond in a square is never interesting because it breaks up the space in such mechanical exactness. It conforms more harmoniously with the lines of the shield.

A few of the most common errors in the Harmony of unrelated shapes are corrected above. These diagrams, which are suggestive of many similar problems the artist and letterer must deal with every day, will serve as working examples and form a basis upon which comparisons may be made.

## OPTICAL CENTER LAYOUT

Strange as it may seem, layouts which are perfectly balanced upon true center, with equal margins all around, will appear bottom heavy. This is just another of the many tricks our eyes play on us. Artists or letterers with a good sense of balance make an instinctive effort to counteract this by placing the copy higher on the card. Professionals know that the most pleasing and effective layouts are balanced about five per cent above the actual center. Since this point is usually measured by the eye, it is called the "optical center."

When arranging copy around this optical center, your layout problems will be simplified by allowing thirty per cent wider margin at the bottom than at the top. The old Greek formula for relative proportions applied to the area in the margins of a panel was something like this—sides 5, top 7, bottom 11. Sho-card artists find it more practical to use a relative scale of 4 for the sides, 5 for the top and 7 for the bottom. This serves as a safe working guide which, of course, may be varied as conditions demand. For instance, in order to have the working examples in this book as large as possible, proportionate margins have been sacrificed.

For those who find layouts difficult to arrange the examples in this book should prove helpful. In balancing a block of copy with an illustration, color mass, or price, the center of attraction in each determines their positions on the poster (see Page 37). When the attraction is equal they are balanced at like distances from the optical center. Should one have greater attraction than another, it is balanced proportionately nearer to the optical center.

The smaller examples suggest another good method of determining when the poster is balanced. Pin it up on the wall and with half-closed eyes study the arrangement of the various blocks or masses. When it seems to hang with an equal division of the values on either side, you may be pretty sure that the layout is all right.

Many of the difficulties encountered by beginners are caused by trying to get too much big copy on a card. The purpose of a show card or poster is to attract attention, make an announcement or sell something and the copy should be limited, if possible, to the essential information. When too much copy is supplied without authority to cut it, play up the feature points for the main and subordinate headings then subdue the rest of the copy so as not to detract from these.

Sketch a miniature layout of the poster to be made, then cut out the different blocks of copy, pictures, etc., and shift them around in the panel until you are satisfied with the way they balance. Try out several combinations with different color schemes. From these you can visually choose the most effective.

The finest of lettering loses its effectiveness when improperly spaced, arranged or aligned. Mediocre or even poor lettering is preferable if tastily arranged in a well balanced mass, of good geometrical proportions, to form a part of the whole design. Lettering in mass or page form, or groups of masses must conform in area to the space in which it appears. *Note appended diagrams.*

## MODERN SHOW CARDS

The idea of what constitutes a good sho-card varies according to locality and individual taste. Each community has its own ideals which are based largely upon the ability of its most accomplished craftsmen or teachers whose efforts are emulated by others. The work of our nationally recognized poster artists and advertising men has a marked influence on local talent.

The main object of a display card or advertisement is to sell something. It should be sufficiently attractive to arrest attention, while its appearance should be worthy of the merchandise it is advertising. Its arrangement must be simple and of a nature that can be read at a glance. Especially does this apply to the catch lines and headings. Perfect lettering does not always mean a good card. With rare exceptions, the best of lettering loses its effectiveness if indifferently spaced and aligned. Mediocre, or even poor lettering is to be preferred when dexterously arranged. Unity and general effect should be the aim rather than perfection of detail.

If decorations or illustrations are used, they should be relative to the subject. A bunch of forget-me-nots on the corner of a display card would not ordinarily boost the sale of truck tires or pork chops. Heavy stereotyped designs, massive cut-outs, colonial pillars, stucco decorations, marbelized arches and a stiff, carved out appearance in lettering are suggestive of tomb-stones. They look as though they were made to last forever, subconsciously suggesting age, or old merchandise instead of freshness. Mechanically, this class of work may be pleasing to look upon, but it does not excite enough action to sell goods. Good work should reflect life, freedom, grace, speed and individuality through its technic. This is acquired only by intelligent, persistent practice with the proper tools and materials.

When you hear the expression "Just Like Print" applied to "Hand Lettering," you may safely conclude that it is too good to be of much commercial value. The judging of lettering by its resemblance to type would kill individuality, and lettering would soon cease to exist as an applied art. All reading characters are adapted from the same basic principles. But though there are many hundreds of different types of alphabets used in the printer's art, no "set-up" job can be compared with the handiwork of the skilled letterer for style, beauty, graceful arrangement and general effectiveness. The experienced letterer does not attempt to produce replicas of type faces, such alphabets are seldom designed for rapid construction with sho-card tools.

The appearance of any alphabet may be changed by altering or adding serifs, etc. But when the basic elements are destroyed, it results in meaningless hieroglyphics and curlycues which are here today and tomorrow decorate the waste basket. All the so-called "modernistic" alphabets that are not built upon a good foundation will be very short lived.

In the selection of a type of letter to be reproduced by hand there are several considerations to bear in mind; first, the media available for its successful reproduction; second, the nature of the surface to be worked upon, and third, the amount of time available, based principally upon the recompense. Generally, it is better to devote a little time to making a rough pencil sketch of the arrangement before starting to letter. Legibility should be the primary consideration and the lettering selected to harmonize. The copy should be arranged in some geometric shape or made to form a part of the whole design. The entire mass must conform in area to the shape in which it goes and if illustrations are used they should face the lettering, in order to direct attention to the copy.

For all kinds of pen lettering, a good quality of litho card board will be found productive of the best results. Its coated, surface permits the pen to be drawn in any direction with clean cut strokes.

When lettering or drawing for newspaper or magazine reproduction, the artist should know something about the printer's rule, which is chiefly this: One inch equals 72 points or 6 picas or 6 ems. 12 points equal one pica. In the standard measurement two inches equal one column or 12 picas. Two columns equal  $4\frac{1}{8}$  inches or  $24\frac{1}{2}$  picas. Three columns equal  $6\frac{3}{8}$  inches—5-point type is the agate line. There are 14 agate lines to the inch, "72" is divided by 5 to find the number of lines; if 6-point type is specified 72 is divided by 6, etc. Height is generally figured in inches and width in columns. Standard newspaper column is two inch with  $\frac{1}{2}$  pica between, others are 13 picas—magazine columns vary. A 24 sheet poster panel is 11 x 25 feet. DeLuxe painted bulletins vary. Sketches are drawn one inch to the foot.

A representative group of hand-lettered display ads and show cards that offer some good layouts.

GEORGE WASHINGTON MOTIF IN ALL-OVER DESIGN

ABRAHAM LINCOLN MOTIF FOR ALL-OVER DESIGN

These four patterns offer suggestions for other similar designs with different motifs.

Decorative borders and corner pieces can be made freehand with the Speedball pens much easier and faster than by any other method or with any other tool ~ ~ ~ Any desired design should be sketched in with a pencil and then retraced with bold uniform strokes using the size and style of pen best adapted to the design ~ For squares or any checker-effects use the "Style-A" square pointed pen and for dots circles or wavy lines the round pointed "Style-B" pen will be found the best ~ Use the flexible "Style-C" or "D" pen for accented strokes.

## THE ART OF ENGROSSING

Engrossing is one of the highest paid branches of the lettering art. The demand for this type of work is comparatively limited, consequently the field is not overrun with good men. For such work, Text alphabets and engrossers' script are generally used.

Originally, Text letters were known as Gothic. But since the printers' classification became the universal standard, much confusion has been eliminated by listing all these letters in the Text family. Every letterer, whether show card writer, artist or penman, should learn a good legible Text. The best one to start with is the Old English shown on Page 65. The flexibility of the Style C pen recommends it for this type of lettering. A more rapid single stroke alphabet is presented on Page 69 and a simplified Brush Text on Page 70 for sho-card use.

Before the printing press, books, documents, manuscripts, etc., were lettered by hand.

We are told that some of the old monks, with sincere religious devotion spent the best part of a lifetime producing a single volume. Since most of these religious works were lettered in Text, these alphabets piously radiate a felling of reverence and dignity. The spirit of Christmas seems to have been woven right into them so beautifully that it is hard to find a substitute qualified for Yuletide messages. Artists can with propriety, use Text alphabets at this season.

Bear in mind that any style of lettering which does not read easily is poorly suited to display advertising, including show cards. Old English letters are hard to read. The extreme fine and ornamental "doo-dads" are a bit confusing. This fault is overcome by using a Style D pen for display cards, headings, etc.

The frosty sides of Mt. Rainier with sunset colors glow  
While all its million Christmas trees are set in sparkling snow  
No tapers gleam, but myriad stars light up the heavens above  
And matchless beauty everywhere reminds us of God's love.  
This love divine makes Christmas Day the peak of all the year,  
And warms the greeting we would send to friends that we hold dear.

Whereas, We the passengers on  
*S.S. Northwestern Voyage 182*  
 southbound have had an exceedingly enjoyable  
 and pleasant time, and  
 Whereas, All the officers and  
 representatives of the  
*Alaska Steamship Company*  
 have exerted themselves in extending every courtesy, and  
 Whereas, It is the desire of all to  
 show appreciation to all  
 those who have so helped us enjoy the voyage, and  
 especially to *Commander Wm. Jensen*,  
 Be it Resolved, That this our appreciation  
 be suitably engrossed, and a  
 copy thereof be presented to *Commander Jensen*,  
 that he may have a lasting remembrance of his  
 friends and guests on this voyage.

Splendid examples of engrossing and illuminating by L. M. Kelchner. Particu'ar attention is called to the decoration, which is harmoniously finished in colors.

## PROFESSIONAL LETTERING

**O**PPORTUNITIES lettering offers as a vocation are tempting when compared with other crafts. Skilled letterers find pleasant, profitable, year-round work in art studios, lithographing plants, advertising agencies, sign and show card shops, and large department stores. Salesmen and window trimmers frequently have opportunities for advancement with substantial salary increase when they can letter satisfactory price tickets and display cards. Their contact with sales and advertising managers reveals real openings in many fields of merchandising worthy of consideration. Those endowed with creative ability find in commercial lettering a fascinating chance for self-expression and personal development. If you have ideas and can express them attractively, you need not worry about making a success. Many universities now offer attractive courses in the science of advertising, in which a knowledge of lettering will prove a decided asset.

Versatility is a big asset. The handicap of those who can letter only one style is that their work looks too much alike. It is a good policy to have a favorite alphabet, one that can be used on the average run of posters. But the letterer who does not learn at least the four basic alphabets fails to get his share of the fun this art affords and cannot expect to receive as attractive an income as the craftsman who has a wide variety of alphabets at his command and knows how to use them.

The part lettering plays in creating the desired atmosphere for a sales message is a phase of advertising that should be better understood. Consistent usage has associated different styles of lettering with various types of articles and with special occasions. (A suggestive classification is offered on Page 45.) In choosing a style for any given subject, the letterer shows wisdom in selecting the alphabet that is in harmony with the message. The addition of a new twist to an old alphabet will inject novelty into the letter and when this treatment fits in with the spirit of the message it increases considerably the success of the appeal and enhances the value of the poster proportionately.

The style of lettering and manner of layout cannot be treated with indifference. For one thing, avoid incongruous combinations and cheap, bizarre effects for these either detract from the article advertised or else create an unfavorable reaction. The sense of fitness that would keep you from putting loggers' equipment and dainty evening gowns or sledge hammers and diamond necklaces together in the same window should lead you to choose appropriate lettering for any occasion. Messages that concern articles representing strength or power are best voiced in letters that harmonize, such as heavy Gothic or block styles; while fancy, delicate things are more fittingly described in light Roman or decorative alphabets, etc. The professional letterer will put as much thought on the layout as he does effort on the lettering.

Beginners will find the manipulation of a brush more difficult than the pen because of the absence of the "feel" of contact that tends to steady the hand. It is also hard to load a brush just right and to work the tip out to a clean edge on the palette. For this reason the use of a brush is not recommended until after the pen has been mastered. For ordinary show cards the pen will be found considerably faster and productive of greater uniformity. Yet every letterer should learn how to use a brush for a large lettering and prices on sales cards, etc.

# CORRECT LETTER SPACING

IS NOT A MATHEMATICAL PROBLEM AND CAN NEVER BE SATISFACTORILY MEASURED WITH THE MECHANICAL RULE. LETTERS SHOULD BE FITTED TOGETHER SO THEY READ CLEARLY AND APPEAR → PLEASINGLY - UNIFORM

THE FOLLOWING DIAGRAM OFFERS A MOST ELEMENTARY WORKING GUIDE

## "NOTE HOW SPACES ARE OPTICALLY EQUALIZED"

WHEN LETTERS ARE MEASURED OR SPACED WITH THE YARD-STICK IF EACH LETTER MADE TO OCCUPY AN EQUAL AREA OR THE SPACES BETWEEN THE SAME WIDTH, THEY APPEAR SPOTTY AND ILLEGIBLE

Note how legibility improves when letters and spaces are 'Optically' equalized

More space has been allowed for the M-N-W&A to equalize their appearance. The following examples illustrate very clearly the advantage Optical spacing has over Mechanical spacing with circular letters

All letters occupy the same area and all spaces are measured equal width. This causes the letters to appear more as individual characters rather than as words. The following illustrates how they should be spaced to insure better reading qualities

This line illustrates by comparison how letters of the same dimensions will read when spaced mechanically\* and when spaced \*optically. The area between various letter combinations should be equalized to insure maximum legibility and prevent ugly gaps (x)

## THE ROMAN ALPHABET

Roman is by far our most beautiful alphabet. It radiates a dignified atmosphere of reliability, elegance and refinement desirable in many classes of advertising. It is especially adapted to conservative publicity and the advertising of quality merchandise. Roman characters furnish the most stable foundation for individualistic conceptions or type innovations in either upright or Italic styles.

The Roman alphabet is an evolution of ancient Egyptian writings. Its development has been traced back some five or six thousand years through the writings of the Greeks, Phoenicians and Persians. The inscription on the base of the Trajan Column in Rome (circa 114 A. D.) records its best early development. Roman lower case came as a later development, about the fifteenth or sixteenth century, and has been subjected to improvement ever since.

The holding and manipulation of the flat reed pen used by the early Italian scribes accounts for the varying order of the thick and thin strokes as they appear in the different letters. For example, the two vertical strokes in the letter N are thin, while in the letter H they are thick and in the letter M they are thin and thick, etc. This irregular order made the Roman capitals very tricky and difficult to produce with speed and accounted in no small measure for the origination of the French half-uncial. This new speed writing appeared in the fifth or sixth century in response to a demand for a faster, more legible style of writing to be used in the revision of a vast number of church books. It was a cross between a crude anticipation of our present-day Roman lower case and the unfinished Roman capitals. It no doubt influenced the development of the Roman lower case and Italic styles that appeared later.

As Roman letters became standardized and were adapted to printing, their most noticeable modification was a slight spur, or serif added to the terminals, increasing both beauty and legibility. A study of present-day styles discloses how the modernized alphabets were created simply by changing the design of the serif or by the addition of a few ornamental touches to the body of the letter (see Page 3).

For descriptive copy or for words of special emphasis, Italics can be employed effectively at a big saving in time and effort. Italic letters are simply slanted vertical letters. In Roman Italics, the thick and thin elements follow more closely the natural stroke of the writing hand with a chisel edge pen. Different shaped pens and oblique holding account for most of the accepted variations in style and finish.

It is interesting to see how cleverly the old scribes took advantage of the action of a reed pen in the designing of their book alphabets. They wasted no strokes and did little patching up, a good lesson for any of us to follow. Letterers must choose the tool best suited to the production of each different style of letter if they want to be successful. No practical craftsman would try to imitate the letters created with flexible, chisel-edged pens using stiff, blunt end tools, any more than a jeweler would try to set diamonds with a crow-bar. Choose the right tool for each job. It is poor business to work under unnecessary mechanical handicaps. Bold letters are best made with pens having flat, bent-up marking tips, while thick and thin letters are made with flexible chisel-edged pens, etc. The pen best suited to the job will, in most cases, form the various elements that make up the letter in a single stroke without retouching. Built up or outlined letters are the chief exceptions.

In learning the "single stroke" Roman, analyzed on Pages 21 and 22, study the individual letters carefully before using the pen. Note where strokes are started and terminated, their order of construction and how the pen is manipulated in producing them. Use a No. 2 Style C pen, making a page of each letter. Next make several pages of the full alphabets, both lower and upper cases, combining a smooth arm move-serifs as uniform as possible and strive to equalize the space between the letters as you work. Good lettering should never appear spotty.

Next practice words and group them into geometric blocks as they would appear on a show card. Round out the circular letters and never unnecessarily crowd a word. Where bolder letters are desired a Style D Speedball will produce heavier elements with the same strokes. As soon as you can juggle these letters with a large pen, try them proportionately smaller with the other sizes, copy the plate shown on Page 1 and then make a few simple posters with this alphabet, using the block system of layout shown on Page 41 in arranging your copy on the card.

Suitable pictures to illustrate the poster may be clipped or copied from magazines, adding a few touches of color to take away the "stuck on" effect. For pasting, rubber cement is preferred because it does not curl the clippings or warp the card, and can be easily rubbed off.

## MOTION PICTURE *Slide and Title* LETTERING

Keeping pace with the astonishing growth of the motion picture industry, the slide studio has grown from the efforts of local photographers to write, "shoot," and color their own slides to the present day studios employing a varied staff of artists, letterers, colorists, etc. Most studios are now equipped for motion picture photography and some for sound reproduction. There are two general classes—one advertising slides, emblazoning the merits of some commodity, and the other theatrical announcements of coming attractions, etc. Slides are made by photographing a lettered card or drawing on to a sensitized glass plate  $3\frac{1}{4}$  x 4 inches. When this plate is developed it is called the negative, from which as many positives can be made by direct contact printing onto similar glass plates as slides are desired. These plates are stained or colored, if desired, and the emulsion slide covered with a piece of clear glass to afford protection against handling, the two pieces of glass being fastened together with binding tape made for this purpose.

The card used for lettering and art work is Title board, 6-ply litho or chip board coated with drop black. (Size usually is 11 x 14.) This drop black is mixed to a stiff paste in gum arabic, mucilage or calcimine glue and thinned to a flowing consistency with water. The glue mixture is handled in warm water. If a water-proof surface is desired, the blank cards can be coated with drop black mixed in shellac and thinned with alcohol or in thin lacquer. Care must be exercised to get a smooth, flat surface.

For single slide orders, the copy is lettered on a white card with black ink. In this case the negative which is the reverse of the original is used for the slide. With a little experience the grey tones for ornamental stunts or illustrations can be handled about as well in the reverse as they are on the black surfaces.

The accurate alignment of letters is of great importance because a slide is so greatly enlarged on the screen. Chalk lines are treacherous as they often leave marks when erased. It is much safer to use a red pencil for marking on black cards and a blue pencil on white ones. Red lines copy as black and blue registers as white on the ordinary photographic plate. If chalk is used, sharpen it to a chisel edge to get thin lines and use a soft chamois to rub them off.

Title lettering is usually single stroke with either pen or brush, and must be opaque. Hair lines are to be avoided to insure clear photographic results. For special features the letters are carefully designed, each a work of art in itself.

In laying out a card, remember that people in the gallery desire to read as well as those in the front seats, and the size of the subordinate lettering should be planned accordingly. Space out the lettering enough to offset its foreshortening when viewed from either side of the screen and leave liberal margins on all cards. For example, on a card 11 x 14 make the top and side margins about  $1\frac{1}{2}$  inches and the bottom  $1\frac{3}{4}$ . A study of the leading film titles will further demonstrate the limitations and possibilities of screen lettering. The most effective layouts seldom contain more than twenty words and look better if limited to about fifteen.

On theatrical announcements, most of the pictorial element consists of photos supplied by the motion picture producers. These are "shot" and copy is overprinted on the film or they are cut out and pasted on the lettered card then touched up with a little art work as desired. The art work should be of a suggestive nature—silhouettes, figures and trees; scrolls, and ornamental vases, etc., treated in soft tones on interesting backgrounds, high-lighted in greys and whites—are very effective. The use of an airbrush is handy in working up backgrounds and silhouette effects and many interesting blendings, mottled greys and cloud effects may be made with a sponge dipped in thin color and pounced onto the card around panels, cut out patterns, etc.

Where it is desirable to save the background for further use, the copy is lettered on a separate black card and a double exposure is made (the two being photographed on the same film, just as the photo of the stars are overprinted). Or the card is cut into some pleasing shape and laid on the background.

Fancy wallpaper samples often make beautiful backgrounds and borders. Considerable care should be exercised when choosing colored material because the photographic value of color is very deceiving. For example, orange, yellow and vermilion look brilliant on black. Yet they have about the same reproduction value as black and scarcely copy at all, while blues have pretty much the same value as white. In using colored cutouts or advertising pictures clipped from magazines, the red, yellow and orange can be painted over with greys to make them copy. Lettering on advertising slides is usually bolder to allow coloring. Slides are colored by staining with dyes or by re-developing with a toning solution which does not affect the whites. Most of the song titles are colored with the "toner."

Working conditions vary greatly in different studios. The smaller studios require versatility and speed, as the compensation is usually by piecework and one man handles both art and lettering. In the larger studios, specialists in either lettering or art work are employed as a high standard of uniformity is demanded, and the artist has time to inject a little individuality into his work.

The moving picture industry is only in its infancy, and it will not be long before every city of reasonable size will have its own motion picture laboratory. With the development of the "talkies," lettering is being limited to the more elaborate title cards and introductions, leaving sub-titles to the spoken word. Yet there is still a field for the title letterer as it will be some time before the "talkies" can be profitably employed for the home movies.

## HOW DRAWINGS FOR COLOR REPRODUCTION ARE MADE

The original pen drawing in black and white used in making the four-color poster cover appearing on this book is reproduced here to illustrate how such drawings should be prepared for engravers' color plates. By comparing it with the finished cover you will note that each mass color has been outlined. These outlines give the engraver the necessary guide lines or boundaries to paint up to when separating, blanking in or spotting out the different colors that appear on each of the individual plates which are all printed from the same photographic negative.

Making a good color sketch for the engraver to follow is the first step. Usually this sketch is about two or three times larger than the printing plates. The color sketch can be changed, worked over or patched up as many times as is necessary until it is satisfactory. The second step is to make a tracing of it, defining all the various patches of color with a clean line. The third step is to smudge the back of this tracing and then transfer it on to the drawing paper or card or else lay it on a glass top desk or window with the light behind it and trace it onto a semi-transparent paper or card. The fourth step is to retrace these outlines with black waterproof ink, using a fine pointed pen like illustration shown here.

The color poster of Mount Rainier appearing on the back cover (which is also shown in halftone on Page 60) was made from three separate black and white drawings—one for each color. Benday was used to get the tints on the different color plates. The steps in drawing were as follows: First, a color sketch was painted. Second, a tracing was made and tinted with transparent inks to match colorings in sketch. Third, the sketch was tacked on a glass with a light behind it. Fourth, semi-transparent drawing papers were laid over it and each of the different colors drawn in black ink on a separate paper ready for the photo engravings. While this method does not guarantee a 100% printing register, due to the stretching or shrinkage of the negatives, it serves very well for most printings and will be found very much less costly.
